

Application Guidelines

1. Polarity

The hybrid aluminum electrolytic capacitors is provided with positive and negative electrodes. Do not reverse the polarity when using. If it is used with the polarities reversed, its life may shorten because of increasing leakage current or short circuit.

2. Prohibited Circuits

Since problems can be expected due to leakage current increasing during soldering and other processes, capacitors cannot be used in the following circuits:

- (1) High impedance circuits
- (2) Coupling circuits
- (3) Time constant circuits
- (4) Connection of two or more capacitors in series for higher withstand voltage
- (5) Circuits to get bad influence by big leakage current
- * In addition to the leakage current fluctuation above, the operational conditions such as characteristics at high and low temperature, damp heat and endurance stipulated in the specifications will affect the capacitance. The fluctuation of the capacitance may cause problem if it is used as a time constant capacitor, which is extremely sensitive to the fluctuation of the capacitance. Do not use it as a time constant capacitor. Additionally, please contact Taiwan Chinsan Electronic Industrial Co., Ltd. for usage of two or more capacitors in series for voltage proof.

3. Over-Voltage

Over voltage exceeding the rated voltage may not be applied even for an instant as if may cause a short circuit.

4. Charge and Discharge

Do not use standard hybrid to applications with rapid charge and discharge cycles. Consult us about capacitors specially designed for rapid charge-discharge cycles.

5. Soldering

The soldering conditions are to be within the range prescribed in the specifications. If the specifications are not followed, there is possibility of the appearance becoming defective and increase of abnormal leakage current and capacity reduction when soldering is conducted under conditions that are harsher than those stipulated.

Sufficient PCB installation space (PCB means Printed Circuit Board after this). Sealing resin of capacitors may have a bulge. The design must give consideration to the standard of height and lead position displacement given in the specifications.

6. Use of Capacitors for Industrial equipment's

To ensure reliability when the capacitors is used in industrial equipment's, design must allow for its capacitance, impedance and other characteristics.

7. Use of Capacitors for Equipment's regarding Human Life

In case of using in equipment's regarding human life (e.g. Space equipment, aeronautic equipment and atomic equipment etc.), be sure to talk over the matter with Taiwan Chinsan Electronic Industrial Co., Ltd. Don't use without recognition document of Taiwan Chinsan Electronic Industrial Co., Ltd.

8. Storage

- (1) Store capacitors with the temperature range between 15 to 35°C and the relative humidity of 75% or less without direct sunshine and store capacitors in the package states if possible.
- (2) Capacitors are recommended that you shall open the bag just before use and capacitors shall be used up.
- (3) Never store capacitors in which it is directly exposed to water, brine, oil or in condensation status.
- (4) Never store capacitors in any area filled with poisonous gases (including hydrogen sulfide, sulfurous acid, nitrous acid, chlorine and ammonia).
- (5) Never store capacitors in any area to which ultraviolet and/or radial rays are radiated.

9. Cleaning

Concerning about HCFC, higher alcohol system, petroleum system, terrene system, water system with surface active agent and other solvents the washing way (separateness or combinations) by soak, ultrasonic wave, boil, vapor etc. is confirmed under the maker's recommendation. Please contact us if you require further details.

10. Notes on Circuit designs for capacitors

10.1 Performance

Use capacitors within the rating and performance ranges defined in this specifications.

10.2 Operating temperature and ripple current

If capacitors is used at a temperature higher than the upper category temperature, or excess ripple current flows through capacitors, there are high possibilities of life cycle reduction or leakage current increasing to cause capacitors defective.

10.3 Leakage current

The leakage current of capacitors may increase slightly by soldering conditions. The application of DC voltage enables the capacitors to be repaired by itself and this leads the leakage current to be smaller gradually.

10.4 Applied voltage

For the reliability of capacitors, it is recommended that the voltage applied to the peak value of the ripple voltage should be less than the rated voltage.

10.5 Failure mode

The life ends mostly due to random failure mode, generally open circuit.

10.6 Insulation

Plastic coated case of capacitors can't guarantee the insulation. Do not use capacitors in areas requiring insulation.

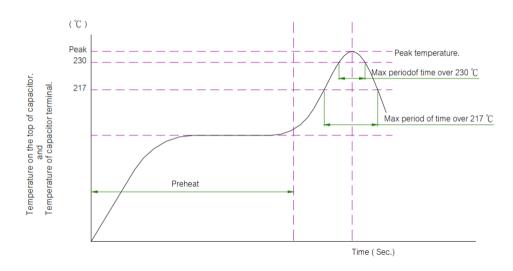

11. Soldering condition for capacitors

11.1 Wave soldering condition for DIP type

Wave soldering	Temperature	Time
Preheating	125°C Max	Within 120 sec
Soldering condition	260+5°C Max	Within 10 sec

11.2 Reflow soldering condition for SMD type

Preheating	>217°C	>230°C	Peak Temp	Reflow times
150°C~180°C	50aaa Mari	40aaa Mari	260°C MAX	1 cycle only
120sec Max	50sec Max	40sec Max	250°C MAX	2 cycles allowed

12. Catalogs

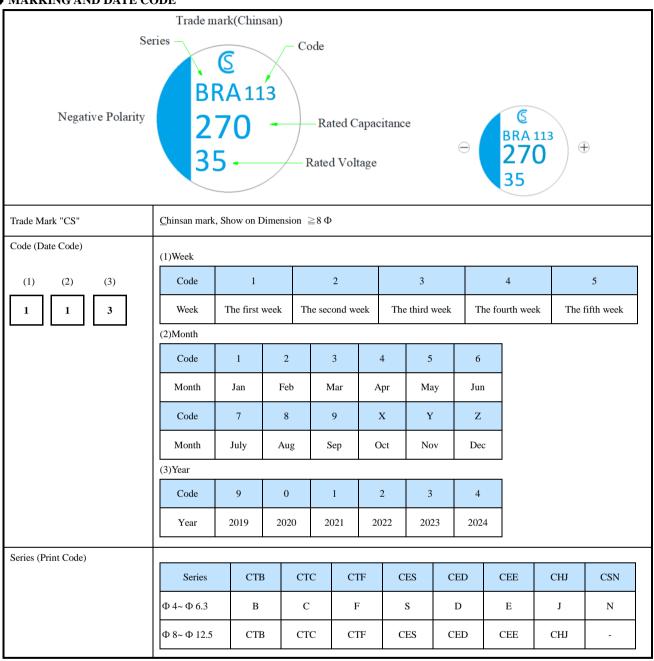

Specifications in the catalogs are subject to change without notice. The data shown in the catalogs are not assured as the whole performance values, but typical values.

For more details, refer to JEITA RCR-2367C (March 2019) with the title "Safety Application Guide for fixed aluminum electrolytic capacitors for use in electronic equipment".

Capacitorscan be comply with JIS C 0029-1989 testing standard with 10,000m flight height cabin environment with temperature control.

- Low ESR at a high frequency range
- High ripple current capability
- Load life 4,000 hours at 125°C

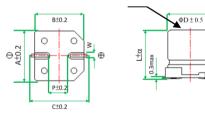

♦ SPECIFICATIONS

Item	Performance Characteristics					
Category Temperature Range	-55 ~ +125°C					
Working Voltage Range		35 ~ 80Vdc				
Surge Voltage		Rated Voltage ×1.15				
Capacitance Range		33 ~ 270 μF				
Capacitance Tolerance		±20% (at 25°C and 120Hz)				
Dissipation Factor (tanδ)	See the standard ratings table (at 25°C, 120Hz).					
Leakage Current ※ 1	See the standard ratings table (Impress the rated voltage for 2 minutes)					
Low Temperature Characteristics Impedance Ratio	$Z(-25^{\circ}C)/Z(+20^{\circ}C) \le 1.5 \text{ at } 100\text{KHz}$ $Z(-55^{\circ}C)/Z(+20^{\circ}C) \le 2.0 \text{ at } 100\text{KHz}$					
	The following specifications shall be satisfied when the capacitors are restored to 25°C after subjected to DC voltage with the rated ripple current is applied for 4,000 hours at 125°C.					
	Capacitance change	$\leq \pm 30\%$ of the initial value				
Endurance	Dissipation factor(tanδ)	$\leq 200\%$ of the specified value				
	ESR	$\leq 200\%$ of the specified value				
	Leakage current	\leq specified value				
	The following requirements s at 85°C 85% RH.	hall be satisfied when the capacitor are restored to 25°C after exposing them for 1,000 ho				
Damp Heat	Capacitance change	$\leq \pm 30\%$ of the initial value				
(Steady State)	Dissipation factor(tanδ)	$\leq 200\%$ of the specified value				
	Leakage current	\leq specified value				
Other	Conforms to JIS-C-5101-18-2 (1999)
